Natural Timber Characteristics

Natural Timber Characteristics

Modinex products are manufactured from genuine solid timber and should be understood as a natural material, not a synthetic or manufactured finish.

Natural variation in colour, grain, texture, knots, figure, coating absorption and board-to-board appearance is inherent to timber and forms part of its character. These variations are expected and do not constitute a defect where they fall within the nominated grade, product specification and applicable Australian Standards.

As timber is a hygroscopic material, it will naturally respond to environmental conditions. Minor movement, checking, weathering and visual changes may occur over time and should be expected as part of normal in-service performance.

All Modinex timber products are supplied in accordance with the nominated species, profile, grade and relevant Australian Standards unless otherwise agreed in writing.

Learn more about timber grading, natural variation and performance <https://modinex.com.au/species>.
